

Nutrition Report 2017

Methibai Devraj Gundecha Foundation's
CHATRABHUJ NARSEE SCHOOL®
From Knowledge to Life

Abhiraj has a total nutrition score of 44 out of 50 possible points. Read on to know what you're doing well and how you can get even better

A higher proportion of blue green indicates better performance. For example, blue/green in vegetables indicates that your child is getting enough vegetables, while more blue/green in junk food and screen indicates your child is getting *less* junk and screen time

Things You're Doing Well

Protein

Abhiraj is getting enough protein. This is great because protein repairs your builds and repairs body tissue and organs, especially vital at this age. Proteins also form antibodies that help prevent infection, illness, and disease. Good job at keeping Abhiraj healthy and safe!

Vegetables

Good job! Abhiraj is getting share of vegetables. They have nutrients that can boost immunity and keep ailments like a common cold and flu at bay. It's especially important that Abhiraj is eating vegetables at this early age because food tastes are formed young. Eating vegetables in a rainbow of colors will provide a wide range of nutrients that will help keep Abhiraj healthy

Fruits

Abhiraj is getting enough fruit. Fruits give you sustainable energy, unlike sugar highs that last a few hours or less. Fruits also have many micronutrients. For example, citrus fruits and strawberries are rich in immune system-boosting vitamin C. Apples contain 16 different polyphenols, which are antioxidants with health-promoting properties. Eating fruits and vegetables in a rainbow of colors will provide a wide range of nutrients that will help keep Abhiraj healthy

Fast Food

Excellent! In comparison to other children, Abhiraj 's intake of the processed and junk food is in check. These foods are high in fats and sugars and low in fiber. Healthy eating habits affects childrenâs physical, mental and physical growth through the essential growing years. And keeping a check on the intake now will only pave for a healthier life during adulthood.

Exercise

Abhiraj seems to be getting enough physical activity. This is especially important at a young age because physical (body) and cognitive (brain) development go hand-in-hand. While this continues for life, this

relationship is most critical at a young age. When kids are active, their brain develops, allowing for new types of activity. Frequent physical activity has been associated with improved behavior in the classroom and beyond. Aerobic activity has been shown to increase the size of essential brain structures and number of neural connections.

Water

Abhiraj is getting enough water. Let this continue as kids don't always recognise the early stages of thirst, which can make them particularly vulnerable to becoming dehydrated, especially during times that can drive up their body fluid losses, for example when they are playing sport or during warm weather. Dehydration, even if only mild, can cause tiredness, headaches, lack of concentration, reduced mental performance and dry skin.

Things You Could Improve at

Below are some tips on how you could improve Abhiraj health and nutrition. After going through the bulleted tips and your appointment with the nutritionist, we recommend you select 3-5 tips to focus on and improve over the next year

Dairy

Abhiraj is currently having more of dairy foods than what is needed at his age. Yes, dairy is good for growing children to help maintain strong teeth and bones, but including too much can mean filling up the children and increasing the chances that they forgo other nutrient rich foods. You could analyse the diet with the nutritionist and make the following changes if applicable:

- Reduce the intake of milk if he/she is having more than 3 servings of milk per day
- Restrict the intake of cheese if it is added to almost all foods (after all cheese can increase the total calorie intake even in children)

Sweet Food

Abhiraj needs to keep a tab on the intake of sugar based foods. High intake can affect the bone development, the brain activity and contribute to unnecessary empty calorie intake. It has been well documented in various studies that high intake of sugar in foods decreases attention span and memory. Some things you can do as a parent to reduce the intake of sugar in his diet

- Parents - lead by example. If children see you snacking on sweet foods and drinks they will follow you
- Set a specific day and mealtime for dessert
- Offer sweet fruits or dried fruits as snacks
- Buy plain yogurt instead of the flavoured one and sweeten it with dried fruits or berries to enhance the taste
